If you don't have a software license for Photoshop, you can't use any of its features. Although you can get a demo version of Photoshop to see if you like the program and can achieve your desired results, and you can likely find a cheap or free copy elsewhere, the program and its features are only available to full-fledged paid Photoshop users. After you get your footing with Photoshop, you can continue on to other software that supports layers, such as a drawing program like Corel Draw or Paint Shop Pro. Working with Layers Photoshop layers enable a single image to be made up of multiple parts or elements. Photoshop layers can move, resize, and rotate, allowing you to edit sections of an image as opposed to just repositioning everything inside of a layer. You can create and add new layers at any time. When you create a new layer, Photoshop creates a background (dark, unlit) layer and places the image you're working on on top of that background layer. When you work on a layer, you apply edits only to the pixels (dimensions) that are part of that layer; everything else on the layer remains unaffected. To work on a layer, you create a new layer using the Layers dialog box (see Figure 10-2, left). You can then make any edits you want, including changes to the layer's color, position, and size. You can remove any part of the image that you don't want to work on (erase), or you can duplicate the part that you want to work on (copy). When you finish, you save the file by clicking the dialog's Save button. **Figure 10-2:** Layers, in case you're too busy to notice. You work with Photoshop's layers in one of two ways: You can either apply edits and work on individual layers or you can work with merged layers. With a merged layer, all the layers are edited together, so you can't separate them after you've created them. You can work with individual layers, of course, but because a single image is made up of multiple pieces, all the pieces must be in one layer in order for you to make edits to any one of them. All the parts of an image can be added to the same layer or to separate layers. This section describes how to create and work with separate layers, and then adds more layers to the image. When you're ready to work on the

Field of the Invention This invention is related to a method for managing memory, and more particularly, to a method for preserving the integrity of a pool of reclaimed memory with lower demands. 2. Description of the Related Art Many applications use a large pool of memory to hold data or objects for future use. The pool of memory may comprise a local or a global pool. Local pools are typically maintained and managed on each computer system, and are conventionally located in the random access memory (RAM) of the computer system. Alternatively, some computer systems may utilize embedded or non-volatile memory for the local pools. Global pools, on the other hand, are typically maintained on a central or remote computer system, and are commonly utilized by a number of computer systems. While local pools are typically managed by the operating system of the computer system, global pools may be managed or maintained by a third party that monitors a global pool and returns or reclaims memory to the pool when the memory is no longer in use. If memory in the global pool is no longer needed, it is returned to the global pool. The global pool is then typically used by other computer systems on the computer system network, such as via the Internet, that require the resources of the pool. Global pools may be used to provide a central repository for shared application data. For example, a global pool may be used for holding shared computer application data, such as database tables or objects, for access by multiple computer systems. Alternatively, a global pool may be used by multiple computer systems for holding data specific to the individual computer systems that is used to facilitate various tasks. For example, a global pool may be used to store the files, registry, or settings of a computer system. In general, when a memory allocation request occurs in a typical computer system, a current pool of
